

EduMap

EduMap is a data-driven project developed to support equitable access to education in Kenya. It focuses on identifying sub-locations with high populations of children aged 4 to 18 but limited access to schools and teachers. By analyzing demographic and infrastructure data, the project highlights under-served areas and quantifies the gaps in educational resources.

Using a standard student-to-teacher ratio of 40:1, EduMap calculates the number of additional schools and teachers needed per sub-location. The goal is to provide education stakeholders in Kenya with actionable insights to guide fair and efficient allocation of resources, ensuring every child, regardless of location, has access to quality education.
